How to run a published application as an administrator

- Parallels Remote Application Server

Symptoms

How to make **published application** run **"as an administrator"** by default.

Resolution

Sometimes it is necessary to make a published application run **"as an administrator"** by default for all users that have permissions to launch it. To accomplish this, please perform the following steps:

- Navigate to the server from which the application is **published**.
- Navigate to the folder where the application is **installed**.
- Right-click the application .exe file and access **Properties**.
- Navigate to **"Compatibility"** tab.
- Click **"Change settings for all users"** button.

- Flag the **"Run this program as an administrator"** checkpoint and apply changes.

Note: From now on this particular published instance will be launched with **administrative rights** for all users that will have enough permissions to launch it. Application started through **Parallels Client** will trigger **Windows User Account Control** so users should confirm that they have administrative permissions.
