

Can I use DisplayLink monitors with Parallels Desktop?

- Parallels Desktop for Mac Standard Edition
- Parallels Desktop for Mac Pro Edition
- Parallels Desktop for Mac Business Edition

Symptoms

I have several DisplayLink external monitors. I want to use them in my virtual machine also. But every time when I try to run my virtual machine all external displays become black. Only when I shut down virtual machine the displays start to work properly.

Cause

DisplayLink drivers conflict with Parallels video driver.

Information

Parallels Desktop **does not support** the DisplayLink drivers at the present time.

If you have the issue with **BSOD** after DisplayLink drivers installation in Windows, please follow this article: [Virtual Machine crashes with BSOD 0x10e on startup](#)
