

## **Unable to perform Mac Operation System Deployment**

Parallels Device Management

## **Symptoms**

I am not using the **IIS Default Web Site** for the Distribution Point, I am using custom site. OSD (Operation System Deployment) task sequence starts to deploy to my Mac, but fails after a certain point during the TFTP file transfer.

## Cause

Custom sites currently are not supported by Parallels Management for Mac.

## Workaround

- 1. Run **appcmd.exe** file (C:\Windows\system32\inetsrv\appcmd.exe)
- 2. Execute the following commands one-by-one:

```
appcmd add vdir "/app.name:SMSWEB/" /path:/pmmimages /physicalPath:c:\pmmimages
```

**NOTE:**(?hange c:\pmmimages to the path to pmmimages that you have specified when you configured **Netboot Server**. (default value is *c:\pmmimages* ))

```
appcmd set config "SMSWEB/pmmimages" -section:system.webServer/directoryBrowse /enabled:True appcmd set config "SMSWEB/pmmimages" -section:staticContent /+[fileExtension='.dmg',mimeType='approximates above restart IIS Web Server.
```
