

Network Discovery does not work

- Parallels Device Management

Symptoms

Unable to install **Mac Client** using **Network Discovery**. Everything configured properly. Just nothing happens.

Cause

SSH configuration - this was configured to allow connection without password authentication.

Resolution

After enabling SSH access on a Mac and granting a local or a domain user SSH access, **make sure** that you can actually connect to it via SSH using the corresponding credentials. The Mac should allow SSH connection with password authentication.
