

How to restrict RDP access through the Parallels Secure Client Gateway port

- Parallels Remote Application Server 18.0

Information

This article describes how to restrict Remote Desktop Connection over RAS Secure Client Gateway port for the end users.

To restrict Remote Desktop Connection for end users follow these steps:

1. Open to Remote Application Server console.
2. Open the list of **Gateways** within your farm.
3. Highlight the **Gateway**.
4. Head to **Tunneling Policies** tab.
5. Double click the **policy** (Usually **Default** policy is used. If you happen to use another policy make sure to double click the used one).
6. Click "**None**" checkpoint.

7. **Apply** new setting in RAS Console.

Note: Performing these actions will restrict native **MSTSC** from accessing the **Gateway** on the RAS Gateway port (default 80) So if the end user will try using **MSTSC ipaddress:80** it won't let them in. Same with RDP connection on the Client pointing to **port 80**.
