

How to add a certificate from Configuration Profile to System store in Keychain Access

- Parallels Device Management

Information

1. Go to **Configuration Items** in SCCM, right-click on the item containing a required certificate and select **Export**.
 2. Open the exported **.cab** file, and retrieve the **.xml** file from it.
 3. Open the **.xml** file, and copy the text from **Description Text** string, excluding the quotation marks.
 4. In browser go to <https://www.base64decode.org/>, and paste the quoted text in the upper frame:
 5. Click on **Decode** button (in **UTF-8** format), and copy the outcome.
 6. Create a empty text document, rename it and change it's extension from **.txt** to **.mobileconfig**. For example: **certificate.mobileconfig**
 7. Open it with any text editor (for example Notepad++), and paste the decoded outcome.
 8. In **SCCM** go to **Configuration Items** and click on **Create Parallels Configuration Item > Mac OSX Configuration Profile from File**.
 9. Select the type **System** and browse to the created **.mobileconfig** file.
 10. Create and deploy a **Configuration Baseline** using that **Configuration Item**.
