

Managing Parallels Toolbox set of tools on Mac

- Parallels Toolbox Business Edition

Information

The list of enabled tools is edited during configuration of deployment options:

1. Visit <https://www.parallels.com/downloads/ToolboxBusinessDownloadMac> and download the toolbox-autodeploy.zip file to your computer.
 2. Right-click the Parallels Toolbox Autodeploy.pkg package and choose **Show Package Contents**. You will see the **License Key and Configuration** folder that contains the deploy.cfg file. Open the file in a text editor (e.g. TextEdit).
 3. The **white_tools_list** configuration parameter under the **List of Enabled Tools** section specifies the tools that should be enabled on Mac computers, and has the following options:
 - ◆ To make all tools available, leave the parameter commented out.
 - ◆ To keep the preconfigured set of business tools (see [KB 124364](#)), use "business-toolset-only".
 - ◆ To enable certain tools, specify the individual tool names separated by a comma with no spaces.
