How to rerun the failed Non-OSD Task Sequence

• Parallels Device Management

Information

When Non-OSD Task sequence fails to install, it is displayed in Application Portal with status Installing failed:

If you would like to rerun the Task Sequence automatically for all the failed Macs, please do the following:

- 1. Delete the current deployment;
- 2. Deploy the Task Sequence to the same collection with **rerun behavior ''Rerun if failed previous attempt''**:

Once Macs receive the updated policies, they will evaluate them and Macs that failed to install the Task Sequence will make a new attempt to run it:

If you configure the recurrence schedule for the deployment, it will keep trying to install the Task Sequence until it succeeds:
