

Apps don't share RD sessions

• Parallels Remote Application Server

Symptoms

When you launch more than one published app, the second app is started in a new RD session. You've already limited users to only start applications from one machine at the time.

Cause

At least one of the apps has enabled option **Disable session sharing**:

Resolution

This option prohibits starting the app together with other apps in the existing RD session and will always create a new RD session for it.

Please disable this option if it's not the desired behavior.
