

Parallels Desktop Business Edition Mass Deployment fails on newly set up macOS Catalina machine

- Parallels Desktop for Mac Business Edition

Symptoms

Using the latest Mass Deployment package, I'm trying to install Parallels Business Edition via a deployment tool (e.g. Jamf/ARD) on a newly set up machine with macOS Catalina installed, but I'm getting the dialog below:

"Parallels Desktop Autodeploy.pkg" cannot be opened because the developer cannot be verified.

Resolution

Before doing Mass Deployment, after preparing the package, right-click the prepared package and select **Open** from the context menu.

Once the following dialog appears, click the **Open** button and wait until macOS finishes the file verification.

After the file is verified, use your deployment tool to perform Mass Deployment.
