

Configuring Software Metering

- Parallels Device Management

Configuring Software Metering

Software metering should be configured for the processes that you are interested in and not for the application files themselves.

For example, there is application **Chess.app** on Macs.

In **Activity Monitor** we can see that its **Process Name** is just **Chess**.

So, you need to specify the **File name** as **chess** in the software metering rule.

Please pay attention that language must be set to - **Any** -:
