

## **Change the default application for a file type in macOS**

- Parallels Desktop for Mac Standard Edition
- Parallels Desktop for Mac App Store Edition
- Parallels Desktop for Mac Pro Edition
- Parallels Desktop for Mac Business Edition

If you want to change a default application for a specific file type, you can easily do that right from macOS, e.g. open .jpeg files inside a Windows virtual machine's applications. Follow the steps below to find out how to achieve that.

1. Right-click on a file, then click on **Get info**.

2. In the **Get Info** options find **Open with** section, where you can easily select which application you would like to be the default for opening your file. In case you configured Apps sharing between your host Mac and guest virtual machine, the apps from the both systems will be listed.

Note: You can also choose applications from your virtual machines and set them as default applications.

3. After selecting the default app for the single file, apply it to all files of the same type by clicking on the **Change All** button in that same **Get Info** window.

4. Then you will be prompted either to **Continue** or **Cancel** this operation. If you want to change default application for all similar files -- choose **Continue**.
