Not enough disk space

- Parallels Desktop
- Parallels Desktop for Mac Standard Edition 10
- Parallels Desktop for Mac Standard Edition

Symptoms

When trying to install or migrate a virtual machine or to drop a file you can see an error **not enough disk space'**, but if you look into your disk information in **Finder** (Get Info), you can see that there is enough space for the file or the operation.

Cause

This is because **Time Machine** is ON and ?eeps temporary snapshots on your Mac primary hard disk.

Resolution

1. First of all, let **Time Machine** sync with the backup hard drive or **Time Capsule**, so you will have the latest backup to restore from if anything goes wrong. Once that's done, eject or unmount the backup drive, if necessary.

Then do this:

1. Go to **System Preferences > Time Machine**.

2. Toggle **Time Machine** from **On** to **Off**.

3. Close the **Time Machine** window.
4. Restart your **Mac** to refresh that storage usage map you see in About This Mac.
