

## How to run a published application as an administrator

• Parallels Remote Application Server

## **Symptoms**

How to make published application run "as an administrator" by default.

## Resolution

Sometimes it is necessary to make a published application run "as an administrator" by default for all users that have permissions to launch it. To accomplish this, please perform the following steps:

- Navigate to the server from which the application is **published**.
- Navigate to the folder where the application is **installed**.
- Right-click the application .exe file and access **Properties**.
- Navigate to "Compatibility" tab.
- Click "Change settings for all users" button.
- Flag the "Run this program as an administrator" checkpoint and apply changes.

*Note*: From now on this particular published instance will be launched with **administrative rights** for all users that will have enough permissions to launch it. Application started through **Parallels Client** will trigger **Windows User Account Control** so users should confirm that they have administrative permissions.
