

Adding RAS Agents from multiple domains

- Parallels Remote Application Server

Information

RAS Components from different domains can coexist in single RAS Farm.

In order to achieve this an appropriate trust relationship between domains must be established.

For instance, should you need to use Publishing Agents from domain A, and RDSH Agents from Domain B, Publishing Agents servers must have appropriate permissions in Domain B.

NOTE: To ensure users can authenticate successfully, please enable the following setting: **Connection > Authentication** tab > select '**All Trusted Domains**'.
