

Publishing Session Timeouts

- Parallels Remote Application Server

By default when a Published Application is closed the session will be disconnected after **25 seconds**, provided no other application is opened within this time-period. These defaults can be changed from:

For version 15.5 and below:

Farm > Terminal Server > Agent Properties.

For version 16 and above:

Farm > RD Session hosts > Agent Properties.

The **Terminal Server Agent** properties includes 2 **Publishing Timeout** values:

Name	Possible Values	Default Value
Publishing Session Timeout	Never, 20 seconds - 19 days	25 seconds
Publishing Session Reset Timeout	Never, Immediate, 20 seconds - 19 days	Immediate

When a session is running Published Applications and the applications are closed, the session checks the Publishing Session Timeout value and disconnects the session provided no other application is started after the selected time period (Publishing Session Reset Timeout).

If **Never** is selected the session continues to run. When the disconnect session is triggered the **Reset Timeout** is checked and the system will reset the session after the **Reset Timeout** has elapsed.

If the **Reset Timeout** is set to Immediate, the session will not go to a disconnect state but will reset immediately on the **Session Timeout**.

Note: If session is using RemoteApps these rules are not applied.
