

How to Distribute Adobe CS using Software Distribution Feature of Parallels Mac Management

- Parallels Device Management

Information

Detailed instruction about how to distribute software to Mac OS X computers can be found in the software deployment section of the [Parallels Mac Management Administrator guide](#).

Before creating a software distribution package you should prepare an Adobe deployment package using AAMEE tool from Adobe. AAMEE tool can be downloaded from the following URL:
<http://www.adobe.com/devnet/creativesuite/enterprisedeployment.html>

To create an Adobe distribution package see the CS6 Enterprise Deployment Guide which can be found at the following URL: <http://www.adobe.com/devnet/creativesuite/enterprisedeployment.html>

Creating an Adobe CS 6 package involves the following basic steps:

1. Download Adobe CS6 Master Collection and AAMEE.
2. Copy the Adobe_CS6_Master_Collectuib.dmg file to a Mac and mount it.
3. Mount and install AAMEE in Mac OS X Mountain Lion Server.
4. Run AAMEE.
5. Specify the path to the mounted Adobe_CS6_Master_Collection on the **Media and Package Identification** pane in AAMEE.
6. Create an Apple disk image from the Adobe deployment package using the following command:

```
hdiutil create -srcfolder <path_to_Adobe_deployment_package> -srcfolder -ov "adobeCS6.dmg"
```

7. Copy the ?.dmg? file to a folder accessible from the Configuration Manager console. When creating a software distribution package, use the folder name and path as the **Source folder** parameter and the following line as the **Command line** parameter:

```
:adobeCS6.dmg/adobeCS6/Build/adobeCS6_Install.pkg::
```
