

Automatic logoff RAS idle session

- Parallels Remote Application Server

Information

Automatic logoff RAS idle session after option defines the timeout for inactive RAS sessions. Users who stay connected to Parallels Remote Application Server farm but do not use published applications will be logged off after the amount of time you specify.

RAS session is considered to be idle if:

1. There are no active remote sessions, i. e. no published applications running.
2. User is not configuring the Farm connection, i.e. Farm **Connection Properties** dialog is not opened.

Note: this option describes connection to Parallels Remote Application Server Farm only. It does not correlate with RDP connections and Microsoft group policies.
