

## **NetworkDomain error 2**

- Parallels Remote Application Server

## **Symptoms**

When you try to launch a published app with Parallels Client for Mac, you get error message:

**Network error has been detected**

**The connection was ended because of a network error.**

**Please try connecting to the remote computer again.**

**[The operation couldn't be completed. (NetworkDomain error 2.)]**

## **Cause**

Non-default remote desktop connection port is configured on the RD session host from which application that you tried to launch is published.

## **Resolution**

- Figure out what port is used by Remote Desktop Services: launch registry editor and check the value data of following registry key:

**HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal  
Server\WinStations\RDP-Tcp\PortNumber**

- Launch **Parallels Remote Application Server Console** and proceed to **Farm** **RD Session hosts**, open the **Properties of RD Session Host** from which affected application is published, switch to "**Agent settings**" tab and enter the value from step 1 to the '**Port**' field:

1. Press **OK** and **Apply**.
