

Parallels USBBoot requirements

- Parallels Device Management

Information

Parallels Mac Management for SCCM V7.0 added an option to boot a **Mac** into **Task Sequence Wizard** without use of **NetBoot** image.

However, imaging **Macs** with **Bootable USB Drive (USBBoot)** still requires the following:

1. **Parallels NetBoot** component should be installed on a **Distribution Point**.
 2. **Windows Deployment Services (WDS)** should be installed on the **Distribution Point**.
 3. If a **Mac** and **NetBoot** server are located in different subnets, **DHCP Relay Agent (IP Helpers)** should be configured. This is required since **PMM USBBoot** is looking for a **NetRestore (System)** image sending broadcast packets over UDP port 67. **IP Helpers** are required for these broadcast packets to reach **PMM NetBoot** server where **NetRestore (System)** images are stored.
 4. **PXE support** is required only for **PMM NetBoot** installation and configuration. Once **PMM NetBoot** component is configured **PXE support** could be disabled on the **Distribution point**.
