

RD Session Host losing "Disabled" state after the reboot

- Parallels Remote Application Server

Symptoms

- An RDSH logon status is "Disabled" (set to "disable logons and connections").
- It is switching to "Enabled" right after server's reboot.

Cause

By design of the "change logon" feature, logons are re-enabled when you restart the system.

Please refer to the official Microsoft

documentation: <https://docs.microsoft.com/en-us/windows-server/administration/windows-commands/change-logon>
