

How to deploy fonts

- Parallels Device Management

Information

Please do the following to deploy fonts to Macs using Parallels Mac Management for SCCM:

1. Put the fonts files (in **.otf** format) to some network share accessible for SCCM like
\\fileserv\shares\Fonts
2. Create a new package from **SCCM Console Software Library Overview Application Management Packages Create Package:**

3. Give it some name, description and enable option **This package contains source files:**

4. Click **Browse...** and specify the path from step 1:

5. Click **Next**, select **Standard program**, click **Next**;

6. Give some name to the command and set this command line:

ditto *.otf /Library/Fonts

7. Set **Program can run** to **Whether or not a user is logged on** and click **Next**:

8. Leave all other settings with their default values and complete creating the package;

9. Distribute its contents to the appropriate Distribution points;

10. Deploy the package to the appropriate SCCM device collection.

Once Macs receive the policy, font files will be copied to **/Library/Fonts** and will become available for all users.
