

MDM Profile Signing

- Parallels Device Management

MDM Profile Signing

You can optionally sign the MDM profile.

When a signed profile is installed on a user device during MDM enrollment, the device will be able to verify the chain of trust and will display the MDM profile as "Verified".

To sign the profile:

1. In the Configuration Manager console, navigate to **Administration/ Overview / Parallels Mac Management / Mobile Device Management / MDM Service**.
2. Right-click **MDM Service** in the right pane and choose **Configure Signing**.
3. The **Signing Certificate Properties** dialog opens. In the dialog, click the **Configure** button.
4. The **Signing Certificate Configuration Wizard** opens.
5. On the first page of the wizard, select the **Enable Signing** option.
6. In the Certificate file field, specify a certificate file. If the certificate file is password-protected, specify the password.
7. Select the **Ensure that the certificate can be verified on a Mac computer** to install the root certificate of the signing certificate as trusted on a Mac computer or Apple mobile device during MDM enrollment. If the certificate that you are using is from a publicly-trusted CA, then the root certificate should be already installed on a device, in which case you don't have to install it.
8. Click **Next** and complete the wizard.

Please note that previously enrolled devices will not get the signed profiles automatically. The existing profiles will continue to function, but will be displayed on a device as "Not verified".
