

## Shutdown or reboot the Awingu appliance

• Parallels Secure Workspace

## Resolution

In previous versions, there was no built-in option to shut down or restart the appliance.

If rebooting the appliance is necessary, you can do so by shutting down or restarting the virtual machine (Guest OS) through the hypervisor.

Since version 5.5, it is possible to perform a shutdown through **System Settings > Global > Troubleshoot**: select the **Shutdown** action.
