

Automatically log off an inactive Remote Desktop Session on Microsoft Windows Server

- Parallels Secure Workspace

Resolution

If a user has inactive remote desktop sessions in Parallels Secure Workspace, the running programs keep running on the back end even though the user is no longer actively connected or using the application. This still consumes power and server resources.

To set up a time limit to end an idle RDS user session, the following GPOs need to be configured:

Adjust these two group policies (GPOs):

Computer Configuration > Policies > Administrative Templates > Windows Components > Remote Desktop Services > Remote Desktop Session Host > Session Time Limits:

- **Set time limit for active but idle Remote Desktop Services session:** Set the desired time limit.
 - **End session when time limits are reached:** Set to Enabled.
