

Publishing a "Click/Run Once" application in Parallels Secure Workspace

- Parallels Secure Workspace

Resolution

On the Remote Desktop Services server:

- Publish **explorer** as a **RemoteApp** on the application server: **C:\Windows\explorer.exe**
- Open properties (right-click on app) of published app and navigate to the "**Parameters**" tab.
- Select the option "**Always use the following command-line parameters**".
- For the parameters, fill in the **location of the ClickOnce app file** (probably with file extension .application), example (screenshot): C:\tmp\test.application
 - ◆ Note: If the ClickOnce app file is published as a URL, it's required to download the ClickOnce app file to the RDS host first.
- Save the changes for the application.

On the Parallels Secure Workspace appliance:

- Publish the above application as a Remote Application. Use the alias that was created for the RemoteApp above (in the example above: "explorer").
