

Automatically provisioning and deprovisioning users

- Parallels Secure Workspace

Resolution

Provisioning

Assuming the user has permission to log in to Awingu (e.g. the user is part of a certain member group, or every domain user is allowed to sign in to Awingu): even if the end user isn't known in Awingu, their account will be created automatically when they sign in for the first time.

It is possible to manually create the **user labels** (mind the subtle difference, it's **not the user account** itself, but the label which can be used to assign specific permissions to this specific user account) using the API during the provisioning process.

https://<your_awingu_env>/api/v2/docs/#labels-create

Deprovisioning

It's possible to use the API to delete users.

https://<your_awingu_env>/api/v2/docs/#users-delete

Note: Depending on the license type, deleted users will still be shown until the end of the month (the Deleted column will have a checkmark) or they will be deleted immediately.
