

CPU Temperature tool shows "--" value

- Parallels Toolbox Business Edition
- Parallels Toolbox

In Parallels Toolbox for Mac 6.0.2 released on February 21, 2023 our Engineering team has made a few tweaks in the CPU Temperature tool to provide our customers with cohesive and easy-to-understand experience.

According to our tests, we noticed that from time to time the Mac sensors indeed reported a temperature of 4-8°C in the idle state, so the tool showed the values given by the Mac sensors. As of now Parallels Toolbox shows the "--" value when CPU/GPU temperature is 8 degrees or lower to avoid possible confusion from our customers.
