Configuring Golden Image for DaaS

Why use Golden Image?

In Parallels DaaS, the Golden Image has two important uses:

- It is the system image that is used on all virtual machines. To change the configuration of the virtual machines, you need to edit the Golden Image accordingly.
- It is the repository of all applications that are available to users. For a user to access an application, it must be installed on the Golden Image.

To edit the Golden Image: See Youtube Videos

Go to the **Golden Image** category, and click the **Edit** button. Parallels DaaS will start a remote connection to the Golden Image. When you open the Golden Image for the first time, the connection will take about ten minutes.
