

Connecting to a non-domain joined Microsoft Windows session host

- Parallels Secure Workspace

Resolution

To connect to a non-domain joined Microsoft Windows session host:

Set the authentication protocol to NTLM instead of Kerberos.

1. Go to **System Settings > Manage > Application Servers**.
2. Locate your application server and press the edit button.
3. Scroll down to **Authentication protocol** and set this to **NTLM**.

Make sure the user is prompted to enter credentials.

1. Go to **System Settings > Manage > Applications**.
2. Locate your application and press the edit button.
3. Scroll down to **Ask for credentials** and set this to **Enabled**.

Kerberos authentication is currently not supported in this scenario.
