

How to create a Windows installation image from a bootable USB or DVD

• Parallels Desktop for Mac Standard Edition

Question

- I have a bootable USB stick (CD/DVD disc) and I want to create an installation image (*.dmg) out of it. What's the process?
- I have a disk with software I want to install to Windows virtual machine, but my Mac does not have CD/DVD drive.

Instructions

These instructions apply to both Windows installation media and 3rd-party software disks.

- 1. Depending on the source type, insert a CD/DVD disc into the CD/DVD-ROM drive or plug-in a USB stick.
- 2. Open **Disk Utility** on your Mac (via Launchpad, Spotlight or Finder).

NOTE: You may use any kind of genuine Windows installation media, full version or upgrade. But please note that upgrade installation media can only be used to upgrade an existing virtual machine (e.g., Windows 7 to Windows 10) - it cannot be used to create a new VM.

- 3. Select the source from the Disk Utility device list. Click File > New Image > Image from "Win10" (where Win10 is the source name)
- 4. Specify a name and location for the image (or leave the default settings) and click Save.
- 5. Type your OS X administrator password:
- 6. Wait for the image to be created:

NOTE: If any I/O errors occur during image creation, this may indicate a problem with your disc or that your CD/DVD-ROM drive is not functioning properly. To solve this issue, contact your local Apple Retail Store or Apple Authorized Service Provider.

- 7. You may now use the image for creating/upgrading a virtual machine. See the following articles for more details:
 - ♦ How do I connect an CD/DVD ISO Image to a virtual machine?
 - ♦ Installing Windows on your Mac using Parallels Desktop
 - ♦ How to upgrade my virtual machine to Windows 10
