

How to run multiple displays in the extended desktop mode in Coherence?

- Parallels Desktop for Mac Standard Edition
- Parallels Desktop

Symptoms

I want to run extended desktop of Windows XP in Coherence mode. But the message appears:

Unable to switch to Coherence Mode. Primary operating system does not support screen resolution request

Resolution

To be able to work in the dual monitor mode:

1. From the **View** menu, choose the "**Customize...**" option.
2. Open the "**Coherence**" tab and check the "**Use multiple displays**" option.
3. Then open Parallels Desktop and go to **Preferences** -> **Appearance** menu.
4. Check the "**Change Mac OS X resolution**" option.

After that please check the resolutions of the monitors that you will use. Change the resolutions of both monitors to be the same. (E.g. if you have a Macbook, change the image to 1024 x768 stretched to match the standard square monitor (4:3 viewing ratio)).
