

How to share virtual machine with several user accounts on a Mac

- Parallels Desktop for Mac Standard Edition
- Parallels Desktop for Mac App Store Edition
- Parallels Desktop for Mac Pro Edition
- Parallels Desktop for Mac Business Edition

Symptoms

I am unable to use my virtual machine on another Mac user account.

Cause

The virtual machine .pvm file is not shared among all Mac users, and permissions are not properly set.

Resolution

If you want to share a virtual machine among several Mac user accounts, you need to place your virtual machine in a directory which is accessible to all those accounts. The optimal variant is the `/Users/Shared/` directory, where you can create a dedicated `Parallels` folder to store all of the virtual machine's files.

Every user should have permissions to read, write, and execute the virtual machine's files.

To share an existing virtual machine among different Mac accounts, do the following:

1. Start Parallels Desktop. On Mac bar click on Parallels Desktop menu > **Control Center** > right click on your Windows virtual machine > choose **Show in Finder**.
2. When the Finder window opens, place a virtual machine's bundle (for example, Windows 7.pvm) in a directory that is accessible to all the accounts that will use the virtual machine. We strongly recommend selecting the `/Users/Shared/Parallels` folder for this purpose to avoid problems with insufficient permissions in the future.
3. Once the virtual machine is moved, you will see it listed in **Control Center** as unavailable.
4. Double-click on the virtual machine's name. A new window will open and you will see an error message saying the virtual machine is not available.

Click **Locate** and specify the new virtual machine location (the folder you have just moved your virtual machine to). The virtual machine will now be available for use.

5. In order for other users to use the same virtual machine, you must set the correct permissions, giving all users who will share the virtual machine read and write permission and allowing permission to all enclosed items as follows:

a) First, decide how you want to share the virtual machine (i.e., among all user accounts on your Mac or only among certain users).

b) Open the Terminal application from **Applications > Utilities**.

c) Go to the public virtual machine's folder by copying the following command in the Terminal window and pressing Return/Enter:

```
cd /Users/Shared/Parallels
```

d) To share the virtual machine with all users, type the following command:

```
sudo chmod -R og+rwX /path_to_virtual_machine_bundle
```

Instead of `/path_to_virtual_machine_bundle`, insert the real path to the `.pvm` bundle you want to share. The easiest way to do this is to drag and drop the virtual machine's bundle icon next to the `sudo chmod -R og+rwX` like this:

Dragging and dropping the .pvm bundle right next to the command string

The full path to the .pvm bundle is now inserted with the correct syntax

Now, press the Return/Enter key, enter your Mac user account password, and press the Return/Enter key again to execute the command.

Note: Terminal does not display password symbols. Just enter your password and press Return/Enter.

e) To share the virtual machine only with specific user account(s), run the following commands from Terminal:

```
sudo chmod -R +a "user_account allow file_inherit,directory_inherit,list,add_file,search,delete,
```

(Note: You should use the corresponding account's login instead of `user_account`, and insert the correct paths instead of `/path_to_virtual_machine`.)

For example, to add permission for user `parallels2` to work with the virtual machine `Windows 7 for sharing.pvm` located in the `/Users/Shared/Parallels/` folder:

- ◆ Type in the following command:

```
sudo chmod -R +a "parallels2 allow file_inherit,directory_inherit,list,add_file,search,de
```

- ◆ Drag and drop the `Windows 7 for sharing.pvm` bundle icon next to the command string:

- ◆ You will now have the following string like that:

- ◆ Press Return/Enter, enter your Mac user account password, and press Return/Enter again.

- ◆ Login from another user account to start the virtual machine.

If you receive an execution message like **Operation not supported**, please enable ACL support with the command:

```
sudo fsaclctl -e -p /Users/Shared/Parallels
```
